From Run 3 to the High-Luminosity Challenge

- **The FASER detector in Run 3:**
  - commissioned during 2021 and started physics data taking in 2022
  - *core technology:* emulsion detectors → unmatched precision for tracking particle interactions. (x ~300nm, θ ~0.07 mrad)
- **The Coming Data Flood (LHC Run 4):**
  - High-Luminosity LHC, collision rate increases by a factor of 5.
  - Massive surge in neutrino events: expected ~30,000 neutrino interactions.
- **The Technology Limit: Why We Must Upgrade:**
  - The emulsion detector saturates (30-50 fb-1) and would need constant replacement: Not feasible.

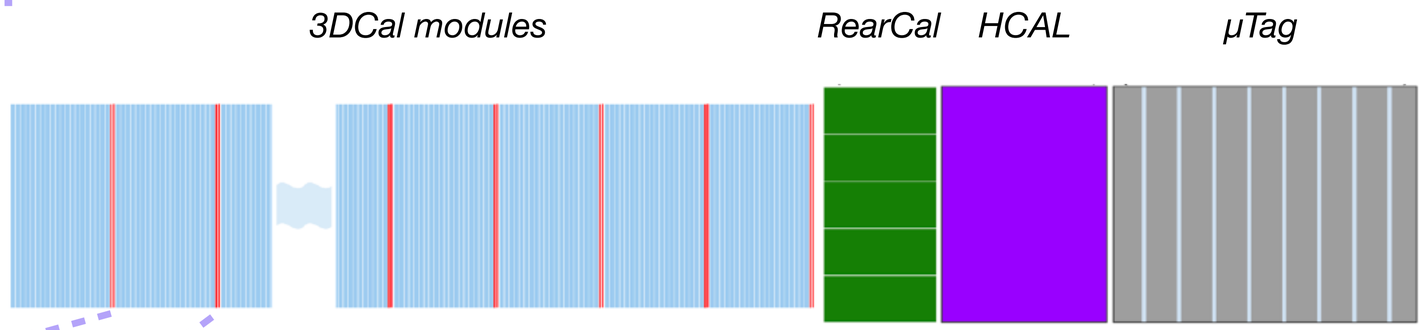
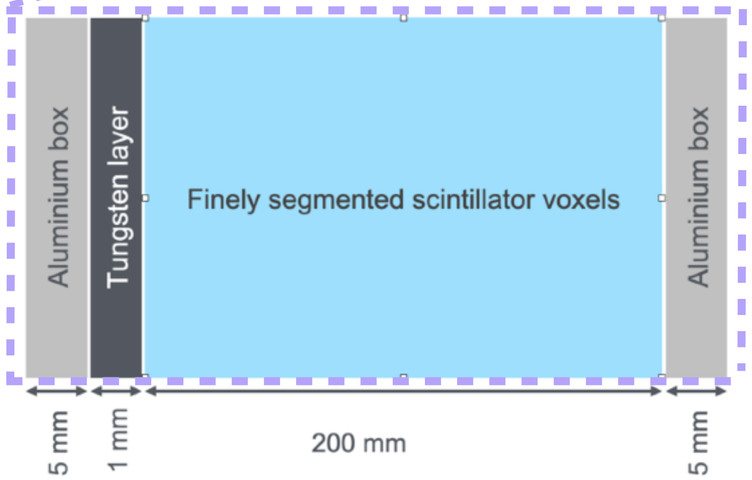
FASERCal Detector Conceptual Design



Proposed Solution: *FASERCal*

- Fully electronic 3D Precision Calorimeter for High Energy Neutrinos, and sub-detectors. (A. Rubbia et al)



- **10 3DCal modules (520 kg):** each with 20 layers of 50x50 3D scintillator voxels → calorimetric information and tracking
- **RearCal**: sampling calorimeter to enhance EM shower containment + energy measurement
- **HCAL**: sampling calorimeter for hadronic energy measurements
- **μTag / spectrometer**: dedicated detector for muon measurement
